Church Closures Dashboard Project

This document applies code highlighting to Verbatim code environments, which are used to render formatted indentation in code blocks because this is not natively supported in Quarto LaTeX documents. Below are the two steps to generate a formatted code block.

1. Paste the code to be highlighted into the `bash_snippets` list item. This will parse all provided code list items using the defined algorithm and generate a new TeX file named `formatted_bash.tex`. The resulting output may require manual adjustments, which can be made in the following two code block sections.
2. Adjust the formatting by pasting the output below where Quarto will apply code highlighting, and in the following `\\begin{Verbatim}` section. The available commands are:

- `\\kw` for Keywords
- `\\func` for Functions
- `\\str` for Strings
- `\\com` for Comments
- `\\op` for Operators
- `\\atr` for Attributes

```
duplicate(church_wide$abi) %>% table()
```

Command-Line Interface

```
duplicate(church_wide$abi) %>% table()
```
